P R O C E E D I N G S

9:39 a.m.

MR. KENNEDY: Good morning, everyone.

Welcome to the second day of our workshop on electricity demand and retail price data requirements.

I want to thank everyone who was able to find us yesterday, as we had to move across the street with the building being closed; and apologize to anyone who wasn't able to join us, particularly the folks on webmail because --

COMMISSIONER BOYD: Obviously, Kevin, I couldn't find you.

MR. KENNEDY: That's right, you were hiding in --

COMMISSIONER BOYD: Hopefully you said I was in L.A. for a power plant hearing, but anyway.

MR. KENNEDY: That's right. And today's meeting is being webcast. We had intended to webcast yesterday's meeting, as well. And I apologize to anyone out there listening on the web who had intended to participate.

We had had problems with the building here at the Energy Commission due to some flooding on Sunday. So nothing was available. We had to

1 find a space across the street and our server was
2 down, so we weren't able to do any webcasting.

3 I don't know whether the Commissioners
4 want to make any initial remarks before we get
5 started today? Okay.

6 At the risk of boring the folks who
7 actually managed to join us yesterday, I'm
8 actually going to go through pretty much the same
9 presentation that I did yesterday, providing some
10 degree of background and overview of where we're
11 going, and how what we're doing today fits into
12 the larger picture of the Integrated Energy Policy
13 Report.

14 My name is Kevin Kennedy, and I'm the
15 Staff Program Manager for this cycle of the
16 Integrated Energy Policy Report. Today's portion
17 of the workshop we're focusing on the electricity
18 retail price data requirements.

19 In terms of the hearing overview we're
20 going to be looking at how the energy report data
21 needs -- how the data needs fit into the larger
22 picture of what we're doing on the energy report.
23 We'll have a brief overview of staff's proposal
24 for data collection on retail price.

25 We'll also have the opportunity for

1 review of and comments on the proposed forms and
2 instructions. So that's the general overview for
3 today's workshop.

4 Putting the data needs into context,
5 there's two main purposes that the energy report
6 is supposed to provide for the state. First, is a
7 need for an integrated policy development on
8 energy matters.

9 Quoting from the Public Resources Code,
10 "The Integrated Energy Policy Report shall present
11 policy recommendations based on an indepth and
12 integrated analysis of the most current and
13 pressing issues facing the state." So, we need to
14 be looking broadly at the issues facing the state.

15 In addition to developing the integrated
16 policy recommendations, another purpose is for the
17 energy report to develop a common information base
18 for all of the various parties and agencies who
19 need to make decisions relating to the state's
20 energy policy.

21 Again, quoting from the Public Resources
22 Code, "For the purpose of insuring consistency in
23 the underlying information that forms the
24 foundation of energy policies decisions affecting
25 the state, those entities" and what's meant by

1 those entities here the law calls out eight
2 specific agencies with some degree of
3 responsibility in terms of energy decisionmaking.

4 As we approach the energy report cycle
5 this time we are taking a fairly broad view of
6 which entities we are hoping will make use of the
7 common information base beyond just those eight.
8 But as the law says, "Those entities shall carry
9 out their energy-related duties and
10 responsibilities based upon the information and
11 analyses contained in this report."

12 One thing that we recognize here at the
13 Energy Commission is that if we expect other
14 agencies and other parties more broadly to make
15 use of the information that's developed during the
16 energy report process, we need to be very aware of
17 and adapt what we do in the energy report process
18 to meet the needs of the other agencies and other
19 players.

20 So, while in some ways this section of
21 the law can be seen as putting some degree of
22 burden on other agencies to make use of what we
23 develop, we very much view it here at the Energy
24 Commission as also putting what may be a larger
25 burden on us to make sure that what we develop is

1 actually useful for the purposes of other parties
2 that we would expect to use the information.

3 One piece of what we're doing within the
4 energy report process is to conduct assessments
5 and forecasts. And what we're here about today is
6 to talk about some of the data and information
7 that the Energy Commission Staff need in order to
8 do some of those assessments and forecasts.

9 Again, quoting from the Public Resources
10 Code, we are given the authority, as it says, "To
11 perform these assessments and forecasts, the
12 Commission may require submission of demand
13 forecasts, resource plans, market assessments and
14 related outlooks from electric and natural gas
15 utilities, transportation fuel and technology
16 suppliers and other market participants."

17 So what we're looking at today is one
18 piece of the data and information that we are
19 looking to require other parties to submit as part
20 of this process.

21 Coming back to sort of the broader
22 purpose of the energy report, one of the key
23 aspects is the need for statewide coordination in
24 what we're doing. The planning process needs to
25 consider the entire state and region, including

1 the investor-owned utilities, the municipal
2 utilities, the electricity service providers and
3 other parties.

4 We're trying to make sure that what
5 we're looking at in terms of energy policy
6 recommendations actually take into consideration
7 all of the players.

8 It also, the planning needs to integrate
9 considerations of load growth, load management,
10 generation planning and transmission planning.

11 And it occurs to me as I'm going through
12 this that the copies that you have, the hard
13 copies, are actually slightly different than what
14 you're seeing on the overheads. One of the things
15 I had forgotten I still needed to do, with the
16 power outage in the building yesterday, was to get
17 the final version of the presentation on the
18 common drive. So this is actually a slightly
19 earlier draft that I'm walking through as we
20 speak. So if you see small differences with the
21 printed versions that were available, that's the
22 reason for that.

23 A key part of the statewide coordination
24 has to do with the coordination that we are doing
25 in the electricity and natural gas forecast, with

1 the procurement process at the PUC, and the
2 transmission grid planning process at the
3 California ISO.

4 I don't believe we have folks from the
5 PUC or ISO here today, but we did have
6 representatives yesterday, both of whom were
7 speaking very much of the shared commitment across
8 all three organizations; to make sure that the
9 energy report process, the procurement process and
10 the transmission grid planning process at the ISO
11 fit together as we move forward on ongoing cycles.
12 For example, the 2005 energy report information we
13 expect to feed into the 2006 procurement process.

14 To this end, or related to this,
15 President Peevey of the PUC issued a ruling in the
16 procurement proceeding last week that speaks very
17 much of the expectation on his part that the
18 energy report proceeding will feed information
19 directly into the procurement process going
20 forward.

21 And spelled out some of the expectations
22 on the PUC side in terms of how those entities
23 under their jurisdiction should expect things to
24 play out in the PUC in the 2006 procurement
25 proceeding.

1 And the expectation that those parties
2 should be looking to the Energy Commission's
3 energy report process as where some of the key
4 issues and discussions will be taking place.
5 There are copies of the ruling available outside
6 if people haven't seen that already.

7 Within that context, the energy report
8 process, we would expect to estimate the need for
9 resource additions, evaluate policies and
10 recommend appropriate resource strategies.

11 The CPUC's procurement process would
12 then produce IOU-specific procurement plans,
13 require competitive generation solicitations,
14 incorporate needed transmission upgrades and guide
15 preferred resource acquisition to insure resource
16 adequacy on a biennial cycle starting in 2006.

17 And then the California ISO's grid
18 planning process would receive information from
19 both the PUC and the Energy Commission's
20 processes; integrate that information into a
21 comprehensive view for the California ISO
22 controlled grid; and then develop project-specific
23 set of preferred transmission projects.

24 One of the things that's extremely
25 important about the Energy Commission's energy

1 report process is that this is a proceeding that
2 provides a forum for consideration of all of the
3 statewide and regional issues. Where the PUC and
4 the ISO are looking at, in the case of the PUC,
5 those entities under their jurisdiction; for the
6 ISO, the members of the ISO controlled grid.

7 We also have an interest in making sure
8 that as we try to develop integrated statewide
9 policy we're looking beyond that very important
10 set of players, but we are also looking to include
11 other players such as municipal utilities and
12 others as we consider the statewide needs.

13 One aspect of what we're doing in terms
14 particularly of the load forecast for feeding the
15 ISO transmission process, we recognize the
16 importance of having consistent disaggregated load
17 forecast information. So that's something that
18 staff here at the Energy Commission and staff at
19 the ISO are going to be working on; making sure
20 that the load forecast developed in the 2005
21 energy report process can be made consistent with
22 the level of disaggregation that the ISO needs for
23 the transmission planning process.

24 We'll also be taking a look in the
25 energy report process at a number of environmental

1 issues. The energy report explicitly includes
2 evaluation of the environmental performance of the
3 electricity system; and we need to find good ways
4 of including consideration of environmental
5 impacts as part of the planning and procurement
6 process as we move forward.

7 In terms of the data collection efforts
8 that we're undergoing for this proceeding, this
9 workshop, yesterday and today, is the first in a
10 series that will review staff's data collection
11 proposals for the 2005 energy report proceeding.

12 The future workshops will focus on
13 proposals relating to data on electricity supply,
14 on natural gas, transmission, environmental
15 impacts, and transportation fuels.

16 We have a very particular format in
17 terms of how we're asking for information, how
18 we're presenting it at the workshop today.
19 Because the types of information needed and the
20 processes that we're expecting to follow moving
21 forward on those may be a bit different, say, on
22 transportation fuels or some of the other areas.
23 You know, it's not necessarily the case that each
24 of the workshops will follow this particular
25 pattern where we have, you know, very specific

1 forms and instructions that we're walking through.

2 But we will be looking in all of these
3 areas at workshops, laying out the general
4 question of what staff is expected to do in our
5 analysis moving forward; what information we need
6 in order to be able to conduct that analysis; and
7 then how we propose to get that information and be
8 able to complete our efforts.

9 Next steps in terms of this particular
10 workshop, after the workshop and review of written
11 comments the Committee will issue an order. We
12 expect probably in the next few weeks or a month
13 directing parties to submit certain data and
14 analyses.

15 As part of that, under direction of the
16 Committee, staff will prepare a revised set of
17 forms and instructions that will accompany that
18 order. And the order will, of course, include
19 filing deadlines.

20 Moving beyond that in terms of the
21 longer term schedule, we would expect to see the
22 load forecasts coming in early next. We would
23 expect hearings most likely in a March timeframe
24 on the overall electricity and natural gas
25 forecast. And moving from there to preparation,

1 under Committee direction, of more specific load
2 forecasts that would be considered for Commission
3 adoption. And some degree of refresh of those
4 forecasts in the fall.

5 One of the things that we're concerned
6 about, as we're trying to supply information for
7 the 2006 procurement process, is to make sure that
8 the load forecast information is not too stale as
9 it goes into that process.

10 In terms of the plan for today, staff
11 will provide overview of the analyses we plan to
12 conduct and how the data analyses we are
13 requesting relate to those plans. We'll take
14 questions and comments sort of on the general
15 issues at that point.

16 Actually before that presentation if
17 there are any sort of general overall comments or
18 questions we'll take those right up front. And
19 then sort of the presentation on what we're
20 planning to do in the large sense. And then
21 finally we'll walk through the forms and
22 instructions. Again, the opportunity for comments
23 and questions as we're walking through the forms
24 and instructions.

25 At the end if anyone has any general

1 closing comments, we'll take those.

2 At this point I expect that this meeting
3 will not go long enough to make it worthwhile to
4 break for lunch, so my expectation is we'll sort
5 of go through and probably be able to get
6 everything done at the very least by very early in
7 the afternoon. It's always a bit of a question
8 mark, how much time in discussion that will be
9 needed on any given topic, so we'll sort of see
10 how that plays out.

11 So that's the end of my presentation,
12 and if anyone has any questions or comments. One
13 thing I forgot to mention at the beginning is that
14 we do have a court reporter here today. We'll be
15 making a transcript of this meeting and be posting
16 that to the website.

17 One thing that's important because of
18 that is if anyone does have questions and comments
19 at any point, that you go up to the one of the
20 microphones, make sure that it's on. We ask that
21 you state your name and what organization you're
22 with, if you're representing an organization. And
23 the court reporter also always greatly appreciates
24 it if you have a business card, if you can sort of
25 drop one off with him as you go up to the

1 microphone, or as you go back to your seat. That
2 makes his job a lot easier.

3 So before we get into the specific
4 presentation on the retail price aspects, are
5 there any general questions or comments?

6 Okay, I guess in that case I can just
7 hand it over to Ruben Tavares who will do the
8 presentation on the retail price forecast.

9 MR. TAVARES: Good morning; my name is
10 Ruben Tavares and I'm part of the staff of the
11 California Energy Commission. Good to see you all
12 here today.

13 What we are proposing, this is staff
14 proposal of data request that we need to collect
15 for forecasting retail electricity prices. Again,
16 it's a staff proposal. We are accepting
17 suggestions. This is the first time that we are
18 collecting actually the data directly from the
19 utilities, the ESPs and the municipal utilities.
20 So any comments, suggestions are welcome.

21 We have about four items to discuss this
22 morning in regards to the retail electricity
23 prices. First of all, we wanted to describe why
24 do we need to project electricity rate prices.
25 Secondly, we wanted to explain what we have used

1 in the past, as far as typical IOU customer, like
2 residential, small commercial, medium commercial,
3 industrial and agricultural customers for both IOU
4 and municipal utilities.

5 In the past we haven't collected data
6 for ESPs or community choice aggregators, but this
7 time around we will.

8 The third item that we wanted to discuss
9 is the present rates, how we use present rates as
10 the basis for forecasting future electricity
11 prices. And finally, we will go over through the
12 projections, both of the generation portion of the
13 rates, and also the nongeneration costs.

14 Why do we make electricity rate
15 projections? Well, first of all, before we move,
16 I wanted to define how we use rates. Rates, we
17 use it as, you know, prices, when we talk about
18 rates we are talking average revenue. That
19 includes all the charges for the customers and all
20 the costs for the utilities.

21 The methodology is still a work in
22 progress, as any methodology, especially for
23 forecasting. As you all know, probably 90, 95
24 percent of the time most projections are wrong.
25 So we're working and wanted to perfect, as much as

1 we can, our projections.

2 The electricity rates are an input to
3 demand forecasts, and if you were here yesterday
4 you probably heard that already. That's one of
5 the main uses of the electricity rate projections.

6 We also use the Commission rate
7 projections for developing the building standards.
8 They have been used also for developing cost/
9 benefit analysis, energy efficiency and
10 cogeneration projects. Even some of the state
11 agencies have asked for electricity rate
12 projections for estimated budgets. And obviously
13 we have a lot of consultant calls all the time.

14 What is a typical customer. In the 2003
15 IEPR we developed what we call a typical customer.
16 For instance, for residential we assume that the
17 usage for a typical customer was about 500 kWh per
18 month. Obviously each and every utility has a
19 different definition of what a typical customer
20 for residential, I mean residential, small
21 commercial and so on.

22 So we have used actually an amended --
23 definition. And this time around we would like to
24 have any kind of suggestions you have. For
25 instance, Sacramento Municipal Utility District,

1 the typical residential customer in this area
2 actually consumes about 640, 650 kWh per month.
3 So each and every utility is a little bit
4 different.

5 Down south some utilities like Pasadena,
6 they might be under 500 kWh per month. So we are
7 open to any kind of suggestions you might have.

8 How do we have estimated this amounts.
9 We actually have used some of the utilities' own
10 submittals to FERC. We have used some of the load
11 profiles that the utilities have posted on the
12 web. And, again, we haven't collected regularly
13 the data from the IOUs, the munis or any other
14 utility. But this time around we would like to.

15 We have also used some rate schedules to
16 represent a specific customer class. As you all
17 know, utilities have numerous rate schedules. For
18 instance, for residential PG&E has more than 20
19 rate schedules. In the past we had used only one
20 rate schedule, for instance, for residential PG&E,
21 and that's E-1 to represent the residential
22 customer class.

23 And the reason we have done that is
24 because, you know, in this rate schedules is where
25 most of the consumption occurs. However, again,

1 this time around we would like to expand it and
2 consider more rate schedules in the, for instance,
3 residential customer class and each and every
4 customer class. And later on we'll describe the
5 forms and instructions of all point, some of them.

6 In the case of municipal utilities,
7 municipal utilities have usually fewer rate
8 schedules than investor-owned utilities. And the
9 staff had used some of its, in this table, to
10 represent, again, customer classes. In the last
11 IEPR we estimated rates for LADWP, SMUD, Burbank,
12 Pasadena and Glendale. This time around we want
13 to expand it to some of the other utilities as
14 long as they have a load of about 200 or above,
15 200 megawatts.

16 And, again, the staff is going to
17 evaluate these rate schedules for this IEPR. And
18 we will again accept any kind of suggestions you
19 might have.

20 Now, present rates. Again, present
21 rates include all the current charges in the
22 tariffs. We accumulate base charges, energy
23 charges, any kind of transmission charges,
24 distribution charges and so on, anything that is
25 in the rate. And that is our basis for estimated

1 future rates later on.

2 For example, for Edison, 2003, we have
3 the average residential electricity rate of about
4 14 cents per kilowatt hour. And as you can see,
5 we have transmission, distribution and so on, all
6 the different charges that are listed in the rate
7 schedule. We accumulate all of them and then we
8 have a total of an average rate.

9 Those are the rates that we provide to
10 the demand office for the demand forecast. Once
11 in awhile they ask for a break-out of the
12 different charges, so we would like to have more
13 accurate estimation this time around.

14 In the case of municipal utilities we
15 have a sample of LADWP 2003 average residential
16 electricity rate; it's about 10.5 cents per
17 kilowatt hour. And, again, municipals list --
18 each and every utility lists their charges in
19 different ways.

20 It is hard for us to standardize any
21 kind of a format to actually represent all the
22 municipal utilities, all the IOUs. Even investor-
23 owned utilities, they list their rate, their
24 charges in a different manner. So we will work
25 with you so that you can give us what you have,

1 and we will accept any kind of suggestions, again.

2 Average present rates for other customer
3 classes besides residential include any kind of
4 charges like competition transmission charges, DWR
5 bond charges, demand charges, customer charges and
6 so on. So we do include all the different charges
7 listed in the tariffs.

8 For instance, you know, PG&E includes
9 reliability services in transmission. That's just
10 one of the differences that, you know, many
11 utilities have. Edison actually separates and
12 lists reliability services into separate from the
13 transmission charges.

14 Municipal utilities have, for instance,
15 what they call a rate stabilization fund. Most of
16 them had it actually a little bit before
17 restructuring, and they had it for awhile. Some
18 of them already have canceled it, and some still
19 have it. So we will be asking for the data, we
20 would like to have all of this kind of revenues
21 and charges that they need to collect from the
22 customers.

23 Now, projections. The next step after
24 the present rates, we have projections. And we
25 would like to have from the utilities, you know,

1 the best estimate or the best assessment of the
2 revenue requirements for the forecast period 2003
3 to 2015. Obviously, 2003 we will have already the
4 actual revenues and the actual costs. 2004 to
5 2015 you might not. So we would like to have
6 those for our estimates.

7 We would like to have the work papers
8 and assumptions you made. So, we might have to do
9 our own estimate, ourselves; either from inputs
10 from other staff of the Energy Commission or any
11 other kind of a scenario that the Commissioners
12 might want to see.

13 All the load serving entities must also
14 describe the methodology they use to allocate
15 revenues among customer classes and rate schedules
16 for the forecast period. As you know, the PUC,
17 the California Public Utilities Commission, is
18 moving back to using marginal cost methodologies
19 to allocate revenues among customer classes in
20 more rate schedules. I also heard that some
21 municipal utilities are using that, too. So we
22 would like to see what your best estimate of what
23 you're planning to use.

24 Future rates will reflect generation and
25 nongeneration costs allocated to customer classes.

1 And again, for generation costs it depends on the
2 utility, but we would like to have all the revenue
3 requirements for utility-retained generation, the
4 nuclear, the hydro; DWR contracts, and again we
5 will talk a little bit more about them; renewable
6 portfolio standards; bilateral contracts and so
7 on.

8 And for nongeneration costs, the
9 transmission, distribution, nuclear
10 decommissioning, trust transfer amount charges
11 which expire in 2007, and again this is for IOUs.
12 So we need those to estimate our future rates.

13 And that's what I have. If you have any
14 questions I would be glad to answer.

15 Oh, it was very clear, huh? I'm glad.

16 UNIDENTIFIED SPEAKER: Are you going to
17 (inaudible)?

18 MR. TAVARES: I'm sorry?

19 UNIDENTIFIED SPEAKER: Are you going to
20 go over the forms?

21 MR. TAVARES: Yes, I am, later on.

22 MR. PRETTO: Mike Pretto, City of Santa
23 Clara.

24 PRESIDING MEMBER GEESMAN: You might
25 make certain that the green light is on --

1 MR. PRETTO: The green light is on.

2 PRESIDING MEMBER GEESMAN: Okay.

3 MR. PRETTO: I was here yesterday, so
4 the reporter should have my card.

5 Just a comment on Santa Clara. We're a
6 small utility; our peak load is -- historic peak
7 load is about 450 megawatts. And the processes we
8 go through in forecasting are, we don't go to
9 nearly the detail that is implicit in your
10 presentation. And just would like to be clear on
11 that.

12 For example, we have a very simple rate
13 structure. And on a forecast basis, for example,
14 we don't forecast rates. We don't forecast
15 revenues by class. For our purposes, on a
16 forecast basis, don't need to do, on a future
17 basis, an allocation of revenues to class and
18 service.

19 Our business is much simpler; much more
20 compact. We have a very small residential
21 component, a relatively small commercial
22 component. We do have a very large office
23 industrial component in our sales structure.

24 But in terms of forecasting, because of
25 the nature of our rates, we can forecast with some

1 accuracy for our purposes on an aggregated basis
2 and don't need to make these distinctions. Just
3 wanted you to be aware of that.

4 MR. TAVARES: Yes, and we understand,
5 you know, the data that we're asking is in an
6 aggregated basis. Obviously we would like to see
7 the workpapers, you know, how you got your
8 estimates.

9 And I understand, you know, many do not
10 forecast, or they say that they don't forecast,
11 you know, rates in the future. I think we, as a
12 staff, and again I'm talking for the staff, we are
13 willing to accept any suggestions and talk to you
14 guys so that we can get to an agreement on how we
15 can best gather the data that we need.

16 MR. ALVAREZ: Manuel Alvarez, Southern
17 California Edison. Ruben, I guess I just have a
18 question. I think you're aware the revenue
19 requirements are an artifact of regulatory policy
20 and ratemaking, at least for the investor-owned
21 utilities at the Public Utilities Commission. And
22 they go out basically in a three-year cycle.

23 And so I'm kind of wondering, you know,
24 where you feel that the longer term revenue
25 requirements come from and where they get

1 generated. Because basically we work through that
2 revenue requirement cycle for ratemaking purposes,
3 and so we know what the short term is.

4 But in terms of forecasting what kind of
5 decisions are going to be made in the future and
6 how that allocation is going to be done, it's not
7 something that we actually forecast, per se.

8 So I'm just kind of curious of how you
9 see that being accomplished.

10 MR. TAVARES: Yeah, we understand that,
11 you know, the utilities, especially investor-owned
12 utilities, go through the three-year cycle. In
13 the first phase of the California Public Utilities
14 Commission they submit their revenue requirements
15 for it this year. And then on second phase they
16 go for the revenue allocation and the rate
17 assigned.

18 But, we're asking the utilities to do
19 their best, you know, the best estimation they
20 can. I think the utilities probably forecast what
21 the rates are going to be in the five-, ten-year
22 range, assuming, you know, you have to make some
23 assumptions.

24 And again, it's very difficult to
25 estimate the regulatory environment in the

1 decisions of the PUC. But, given the costs and
2 given the needs that the utility have, that's what
3 we're asking for. So, --

4 MR. ALVAREZ: So I guess it's basically,
5 you know, what assumptions you're willing to
6 accept in terms of outside the ratemaking period.

7 MR. TAVARES: Well, again, as a
8 business, and as a utility, you know, have to do
9 business in the --, I'm pretty sure that investor-
10 owned utilities and munis, they do have to see
11 what the projections are, what they are looking at
12 in the next probably ten years so they can
13 compete. And that's what we're asking for.

14 MR. ALVAREZ: Right, but you're aware of
15 the vagaries of the, you know, the ratemaking
16 process and the regulatory policy decisions that
17 will affect that, so that the question I have is
18 then how much certainty can you put into those
19 longer term rate forecasts.

20 MR. TAVARES: Well, as any forecast, I
21 think there's a lot of uncertainties; and
22 especially in the regulatory arena. I mean the
23 same is true for the municipal utilities. I mean
24 you never can predict what the board of directors
25 of the munis are going to do.

1 Nevertheless, I think we will be
2 focusing on the prediction for the cost and the
3 revenue requirements for that.

4 MR. ALVAREZ: Thank you.

5 MR. KENNEDY: I think at this point,
6 since it looks like there's no other general
7 comments, we can just move straight on to the
8 forms and instructions. Once we get that loaded
9 up, Ruben will take it again.

10 MR. TAVARES: You have a second handout
11 that describes the forms and instructions. It
12 lists the data that we are requesting from the
13 load serving entities.

14 Again, this is the first time that we
15 are collecting data using forms to estimate retail
16 electricity prices. As with any form, you know,
17 some categories might not apply to some utilities,
18 and some others are not listed. So we are asking
19 you to actually provide us and suggest, you know,
20 which categories -- which you include in your own
21 specific data submittal.

22 The forms that we send out are forms 1.a
23 through 1.c. Those apply to the investor-owned
24 utilities. And, again, we took those, the data
25 that we're requesting from those forms from the

1 submittals of the IOUs to the California Public
2 Utilities Commission. So we tried to mimic what
3 you already provide for the general ratecases to
4 the California Public Utilities Commission.

5 Forms 2.a through 2.c, they apply to
6 municipal utilities and irrigation districts.
7 And, again, each and every municipal utility is
8 different. We understand that. But we must -- we
9 provide those data lists mimicking, again,
10 investor-owned utilities, but I think that you
11 can -- you should be able to provide us with some
12 categories that might be different, but will give
13 us an idea of how to estimate the rates.

14 And energy service providers and
15 community choice aggregators, we have only forms
16 3.a through 3.b. And that's just two forms. And
17 we have never collected data directly from energy
18 service providers. But this time around we will.

19 What have we done in the past. In order
20 to estimate rates in the past we have used
21 actually FERC information that the investor-owned
22 utilities provide in the FERC form. We have used
23 the California Public Utilities Commission public
24 data for inputs to the rate forecast.

25 And the results haven't somehow

1 satisfactory. I mean we had some good feedback
2 from the IOUs. This time around we're asking for
3 revenue requirement categories, again similar to
4 the phase two of the CPUC's general ratecase
5 proceedings, you know, where the IOUs submit their
6 proposals every three years.

7 Form 1.a in your package is asking for
8 electricity by source. And the revenue
9 requirement category like DWR contracts,
10 renewables, transmission. This is for the
11 unbundled customers. And you should have only one
12 form a from each utility. That's for the total
13 investor-owned utility.

14 Form 1.b, we are asking for electricity
15 sales and revenue requirements per category. This
16 is the allocation down to customer classes.

17 And form 1.c, again, the same
18 electricity sales and revenue requirements down to
19 the level of the rate schedule.

20 So the difference between 1.b and 1.c is
21 just that 1.b asks for revenue allocations to
22 customer classes, and 1.c to rate schedules.

23 We are asking for, again, historical
24 allocations and revenue requirements for 2003, and
25 for the forecast period 2004 to 2015. We are

1 asking for aggregated amounts, and again, work
2 papers.

3 The categories that are included in form
4 1.a are the DWR contracts. As I understand and
5 I've seen some of the submittals to the PUC, you
6 ask for revenue requirements for DWR contracts.
7 Those are the must-take and the dispatchable
8 portions of energy from DWR. And the total amount
9 of revenue requirements including DWR
10 administrative costs.

11 The second category is the utility-
12 retained generation. Again, we are asking
13 whatever you have submitted for nuclear regulatory
14 requirements and allocations. QF contracts, and
15 again, for the projection period we're asking for
16 the goals according to -- by the CPUC decisions,
17 for the hydro, whatever has been approved by the
18 PUC already, and for 2003, and projections, and
19 your own generation.

20 Renewable energy estimates for renewable
21 portfolio standard and goals in the Energy Action
22 Plan. We're asking for spot market prices and
23 revenues to fill out the (inaudible).

24 We have separated energy efficiency
25 programs from the public purpose programs.

1 Revenue requirements, we would like to see what
2 your proposals are. We're asking for transmission
3 revenues. Again, the ones that FERC has already
4 adopted for 2003, and what your best estimate for
5 the future.

6 Reliability services. If those are
7 separated from transmission we'll ask for those.
8 And, again, we're open to suggestions.

9 Some utilities actually list regulatory
10 assets, that's a special expense, it's recoveries
11 that they have, or the California Public Utilities
12 Commission has approved for the specific
13 utilities.

14 We're asking also for fixed transmission
15 charges; we know those expire in 2007. Those are
16 the amount that were used to finance the 10
17 percent rate reduction that small commercial
18 customers and residential customers receive back
19 in 1998.

20 We're also asking for DWR bond charges;
21 those that finance -- funds that were used to
22 finance the emergency purchases during the crisis.
23 And, again, nuclear decommissioning estimates that
24 you provide to the PUC every three years.

25 Public purpose programs charge and

1 revenues, cost includes the CARE program and RD&D
2 programs. And some of the categories that we have
3 not included, and again, we would like to see
4 those.

5 Forms 1.b and 1.c, we're again asking
6 for the allocations to the different customer
7 classes in 1.b; and in 1.c allocations to rate
8 schedules. We would like to see from the
9 utilities specific method of allocation that you
10 are proposing or that the PUC has already
11 approved.

12 For some categories we have system
13 average percent, the equal percent of marginal
14 costs or some categories of revenues are allocated
15 on an equal cents per kilowatt hour, like DWR
16 contract revenues.

17 For instance, PG&E allocates revenues to
18 this customer classes, and I guess they are
19 different from Edison. But the residential class
20 has actually five different rate schedules. So we
21 would like to see the allocation done to the
22 residential class plus the rate schedules E-1, EL-
23 1 and so on.

24 Now, forms for municipal utilities and
25 irrigation districts. In the past, actually the

1 last IEPR, we used data that we collected from the
2 EIAs forms 412, and also some data that we used,
3 we collected from some financial statements, some
4 financial reports that the munis post in their
5 website. We have been a little more difficult for
6 the last probably four years to acquire this kind
7 of data.

8 We're asking for revenue requirements.
9 Again, we actually mimic this categories from the
10 IOUs which will not be as specific, which may not
11 apply specifically to the municipal utilities and
12 irrigation districts.

13 Form 2.a, we're asking for electricity
14 by source and revenue requirements per category.
15 You will have only one form 2.a for each muni and
16 irrigation district. We ask that just for the
17 whole utility.

18 Form 2.b, we are asking for electricity
19 sales and revenue allocation to customer classes.
20 And again, we would like the munis to consider
21 only customer classes with a 10 percent or more of
22 utility on their sales. I mean there are some
23 very small customer classes that their sales are
24 below 10 percent. We actually don't want those.
25 We just want the ones at 10 percent or more.

1 Form 2.c, we are asking for electricity
2 sales and revenue requirements by category. And,
3 again, allocations to rate schedules. And only
4 rate schedules with 10 percent or more of customer
5 sales within the customer class.

6 In the form 2.a, for municipal
7 utilities, we are asking for a utility's own
8 generation revenue requirements; bilateral
9 generation contracts that you may have; renewable,
10 compliance for renewable portfolio standard and
11 other goals; spot market purchases; transmission
12 distribution. Again, (inaudible) that in the past
13 has been critical for the munis. We would like to
14 have those. And, again, we are asking for your
15 suggestions.

16 And forms 2.b and 2.c, again allocation
17 to customer classes with minimum 10 percent of
18 utility total electricity sales, and allocation to
19 rate schedules with minimum 10 percent customer
20 class electricity sales.

21 Forms for energy service providers and
22 community choice aggregation. Again, we have not
23 estimated retail prices for these entities in the
24 past. This is going to be the first time we're
25 asking for revenue requirements for the categories

1 that we listed in the forms, form 1.a and form 1.b
2 -- I'm sorry, form 3.a and 3.b.

3 We don't have each ESP is unique; each
4 community choice aggregator will be unique. So we
5 are asking for your proposals.

6 Forms 3.a and 3.b, again, energy service
7 providers might have generation contracted;
8 estimation of spot market prices. They do have
9 contracts with IOUs and municipal utilities to
10 transmit the power, so they have to pay those
11 charges to either the IOU or municipal utility.
12 They also have some kind of an agreement with
13 investor-owned utilities for distribution
14 services. We'd like to have those estimates.

15 And that's all. Any questions?

16 MR. BAZZAZ: My name's Jafar Bazzaz; I'm
17 representing Los Angeles Department of Water and
18 Power. Before I make any comments I want to make
19 sure that everyone understand the policy has been
20 to fully cooperation with staff before, and that's
21 what we intend to do.

22 But at the same time you should take in
23 consideration what's physical for us, take in
24 consideration the manpower we have right now after
25 downsizing.

1 And efficiency that we like to see.
2 Wonder is possible if you can put that slide back
3 for municipal utilities?

4 I don't see the detail of the form here,
5 but I looked at the detail at the form and if the
6 type of the question you're asking is leading to
7 my understanding, that you look at the municipal
8 utility like the IOUs.

9 They don't look at the revenue
10 requirement, as the IOUs (inaudible) revenue
11 requirement. If your goal is at the end to have
12 the rate you shouldn't put (inaudible), because
13 all the information you're asking me to provide is
14 not going to make it able for you to forecast a
15 rate. A rate is not driven by revenue
16 requirement. A rate is driven by a financial
17 policy or bond covenant on a financial ratios.

18 So all this information that is going to
19 cost a lot of time to provide, I don't know what
20 the use of it. If you can explain it to me, I
21 appreciate it.

22 MR. TAVARES: Yeah, and again, I mention
23 before, that we actually had not collected this
24 information directly from municipal utilities.
25 And we tried to mimic, you know, revenue

1 requirements from the investor-owned utilities and
2 impose it into the munis.

3 I mentioned several times that we would
4 like to, you know, have some suggestions from you,
5 or receive some suggestions on how we can do it.

6 MR. BAZZAZ: My suggestion is if end
7 goal is to have the rate, we can put a wide rate
8 that we are using in our load forecast, and is
9 going to be part of our assumption when we file
10 the load forecast. We file all the assumption.
11 And part of it is going to be what we have used
12 for the price of electricity for each class of
13 customer.

14 MR. TAVARES: If you going to provide me
15 with the work papers on how you get the rate, and
16 your assumptions behind it, I believe that that
17 might be -- I mean we can talk it over, that might
18 be acceptable.

19 But, again, our purpose is to see, you
20 know, what your assumptions are versus what kind
21 of a wholesale electricity price you used in the
22 open market, you know, for your open purchases, if
23 any. What kind of assumptions you have. And so
24 that we might be able to provide different
25 scenarios if the Commissioner ask for it.

1 MR. BAZZAZ: I can provide you with the
2 financial plan that we have for forecast, that
3 it's going to give you all the information about
4 the net revenue we assume from wholesale activity;
5 what's our forecast retail; what's our average
6 rate is going to be; what's our O&M is going to
7 be.

8 What's a lot of accounting issue is
9 going to drive the rate. For example, you have
10 the deferred revenue that is going to drive the
11 rate in the future. That's a noncash item that's
12 not going to affect any of our form that you ask.

13 MR. TAVARES: Well, again, as long as we
14 are able to see the work papers and how you got to
15 your price forecast, I think, you know, from the
16 staff point of view, that will be acceptable. And
17 we will talk to you, you know, about that.

18 PRESIDING MEMBER GEESMAN: You make
19 projections in your official statement every time
20 you sell bonds, though, don't you?

21 MR. BAZZAZ: No, we don't have the
22 forecast in our -- we have the actual, we have the
23 audited.

24 PRESIDING MEMBER GEESMAN: Yeah, but
25 I --

1 MR. BAZZAZ: Every time you sell the
2 bonds you have the audited for last quarter.

3 PRESIDING MEMBER GEESMAN: Right.

4 MR. BAZZAZ: Audited financial
5 statement. However, we have the financial
6 statement forecast for the next 15 years, that
7 based on that we see what kind of rate increase we
8 need in the future.

9 PRESIDING MEMBER GEESMAN: And you carry
10 that out 15 years?

11 MR. BAZZAZ: We have that up to 2017.

12 PRESIDING MEMBER GEESMAN: And do you
13 break that down by customer class?

14 MR. BAZZAZ: We have the ability to
15 break it down to customer class.

16 PRESIDING MEMBER GEESMAN: Do you
17 present similar type of information to the rating
18 agencies before your bond issues?

19 MR. BAZZAZ: We provide the same type of
20 information to rating agency, not to 2017, usually
21 maybe ten years.

22 PRESIDING MEMBER GEESMAN: Okay. But
23 you --

24 MR. BAZZAZ: They are not interested
25 more than that.

1 PRESIDING MEMBER GEESMAN: Okay. It
2 seems to me you have a wealth of potential data
3 that would be relevant to the staff's interests.
4 And it's not our intent to impose new or onerous
5 requirements on you, but simply to gather access
6 to the data that you do have.

7 MR. BAZZAZ: As I mentioned, the
8 information available and needed take into
9 consideration the confidentiality and other policy
10 the Department has. We are going to provide.

11 PRESIDING MEMBER GEESMAN: And I
12 certainly appreciate the cooperation that the
13 Department has shown throughout this process.

14 MR. BAZZAZ: Thanks.

15 MR. PRETTO: Mike Pretto, again. Just a
16 brief follow-on on the category of revenue
17 requirements. In our budget forecast in the City
18 of Santa Clara, we do have a five-year forecast of
19 what you might call revenue requirements.

20 But that's not necessarily indicative of
21 rates or rate requirements. For example, if I
22 have out in the, say in the fourth or fifth year
23 of this time horizon, indicate a potential
24 shortfall, in other words a shortfall relative to
25 incoming revenues, one of the options we have as

1 we go through time is to figure out what kind of
2 cost-cutting measures we might implement so that
3 that indication of a shortfall doesn't come true.

4 So that revenue requirements, as you
5 forecast them, don't immediately translate into
6 rates. And that's one of our concerns, about how
7 the data might be used.

8 MR. TAVARES: Well, again, I think
9 everybody can do their best in estimating, you
10 know. There's some assumptions behind it. And we
11 will consider those assumptions.

12 MR. McLAUGHLIN: Bruce McLaughlin,
13 California Municipal Utilities Association. We're
14 here as an earpiece rather than a mouthpiece.

15 We do have what we have been presented
16 as a staff proposal, new data collection forms, et
17 cetera. So, as I bring this information back to
18 our collective and diverse membership one of the
19 things that would really be oil on the water, of
20 course, is a more specific statutory reference to
21 the ability of the CEC to collect this.

22 Also, we talked about the different
23 forms and some of the different utilities have
24 expressed their different type of information that
25 they have. Commissioner Geesman just suggested, I

1 think, in the Public Resources Code that any
2 utility would only have to give the data that they
3 possess, control or have the ability to acquire.

4 So, as we go through this process I
5 would assume it's going to be public workshops,
6 comments, et cetera, so we can reach a grand
7 conclusion.

8 PRESIDING MEMBER GEESMAN: I think that
9 200 megawatt threshold is probably relevant to
10 your members, as well.

11 MR. McLAUGHLIN: Right.

12 PRESIDING MEMBER GEESMAN: That's
13 something I think ought to be kept uppermost in
14 mind.

15 MR. McLAUGHLIN: And also yesterday we
16 talked about LSEs and an LSE list. Now, I know
17 with this integration of the PUC and the RAR
18 proceeding, their definition, at least in the
19 interim opinion, an LSE is an IOU, an ESP or a
20 CCA. Of course, the muni utilities are neither of
21 those.

22 And so if we could sort of just wrangle
23 with that definition, and possibly get that list,
24 I would appreciate it greatly.

25 Thank you very much.

1 PRESIDING MEMBER GEESMAN: You bet.

2 MR. TAVARES: Any more questions?

3 Comments?

4 MS. TRELEVEN: Kathy Treleven, PG&E.

5 This whole thing seems a little bit new and we're
6 still wrangling with exactly the scope of it. I'm
7 surprised to see the discussion of the revenue
8 requirements as only an input, because essentially
9 they were an output of our long-term plan, as
10 well.

11 And there's some interesting things that
12 you can do as you look at the different scenarios
13 and the magnitudes of revenue requirements, how
14 they change under different transmission
15 scenarios, for example.

16 And I guess I could say that since
17 Thursday's CPUC decision we're all looking forward
18 to a better definition of how we will work through
19 this process.

20 In terms of the data requests that we
21 have in front of us for the next few months'
22 exercise, the main concern that I am getting from
23 internal folks -- well, there are two concerns.
24 The first is confidentiality. And I'd like to
25 hear a little bit more about whether that can be

1 provided, and what the plans are. I apologize for
2 not showing up a little earlier.

3 And secondly, there's a long-standing
4 concern about accuracy once you get out past three
5 or five years. There are probably something like
6 60 rate cases, or 60 different cases before the
7 CPUC and the FERC that will determine our revenue
8 requirements. So, one wonders how much you work
9 through those different components and best guess
10 efforts at where we'll stand when those cases are
11 closed, compared to just taking a transmission and
12 distribution revenue requirement and forecasting
13 it through time at some sort of nominal growth
14 rate.

15 Those are some of the initial
16 perceptions that we've had at PG&E and we will
17 look forward to sharpening up the process and
18 figuring out how to comply with these requests.
19 We see no problem with the numbers being in front
20 of us, except for those two, confidentiality and
21 precision concerns.

22 PRESIDING MEMBER GEESMAN: Let me give
23 you an initial reaction to both, Kathy. On the
24 confidentiality question Southern California
25 Edison raised the same issue yesterday. And, at

1 least as I understood their request, they
2 suggested that we adopt the same approach and
3 definitions currently utilized by the CPUC.

4 I explained that we can't do that; that
5 we have a different statute and different regs
6 that govern our approach to confidentiality. And
7 that at least for the time being we are incapable
8 of providing any advanced guidance beyond
9 suggesting a careful scrutiny of our regs and our
10 statute.

11 Now, that being said, we will sit down
12 with our Executive Director, which is where the
13 actual authority for confidentiality
14 determinations resides, and determine if he is
15 able to issue some advanced guidance as to the
16 parameters that he believes would be relevant and
17 consistent with our regs. And if we're able to
18 provide that, we will.

19 As it relates to precision or accuracy,
20 I think those are very well founded concerns. And
21 I think one of the real dilemmas that we face,
22 there was a lot of discussion yesterday from
23 people that were relative old-timers in the room,
24 saying that they hadn't done this since 1996.

25 And obviously capabilities, both within

1 state government and within the utilities, has
2 atrophied a fair amount since 1996. And I think
3 we need to recognize that.

4 I have to say with a fair amount of
5 embarrassment I haven't done this since 1982. And
6 the approach, frankly, that we took in 1982 was a
7 lot more detailed, and a lot more rigorous, and I
8 think had a lot more at stake, or at least we felt
9 that it did, than what had evolved by 1996.

10 For better or for worse, the state seems
11 to have moved a fair direction toward integrated
12 resource planning and a state-supervised or -
13 sanctioned utility procurement system, which does,
14 in fact, call for advanced guidance consistent
15 with AB-57 in the procurement process. And which
16 calls for some fairly long-term decisions;
17 decisions with at least a ten-year horizon, and in
18 some instances, in the RPS program, even longer
19 horizons than that.

20 So we all face a struggle to try and
21 make those decisions which the state will be
22 called upon to provide its stamp of approval for.
23 We all face the dilemma of trying to make those
24 decisions as well informed and based on as much
25 accurate information as possible.

1 I think we ought to be honest about
2 ranges of assumptions and caveats that need to be
3 made. But I think in the final analysis what's
4 expected of state government and of your industry
5 is to arrive at some consensus choices, and a
6 commonsense approach to making some of these
7 choices.

8 MS. TRELEVEN: Thank you. I agree that
9 the tools have atrophied and the questions have
10 gotten harder. And we look forward to setting up
11 a process with you and the CPUC and ourselves to
12 move forward.

13 PRESIDING MEMBER GEESMAN: Thank you.

14 MR. BASS: Good morning, Commissioners.
15 My name is Greg Bass and I'm here representing
16 ARM, the Alliance for Retail Energy Markets. And
17 I'm a member. I work for an ESP that is a member
18 of ARM.

19 I'd like to thank the Commission and the
20 staff for making this workshop available and
21 allowing the different market participants to come
22 in and to offer their different takes on this
23 particular item.

24 In general, ARM supports not only the
25 policy, but also the process that's evolving here.

1 And as I mentioned yesterday, one of the items
2 that is important to our members that I've also
3 heard from other market participants is
4 confidentiality.

5 And my assumption here is that we'll
6 file, for the September 30th we'll file some
7 written comments on that particular subject.

8 I have some detailed questions,
9 actually, regarding form 3 that I would like to
10 ask.

11 On form 3.a you've broken out the
12 generation into different categories. And my
13 members would like to know exactly what is the
14 difference between spot and a bilateral contract.
15 And maybe, especially as you go forward into the
16 further years, our definition of spot is something
17 that occurs that day. And so we wouldn't know how
18 much spot we would have as we go forward. Spot is
19 usually done to just kind of fill in.

20 So I'm wondering if maybe -- one of my
21 members was asking if spot and bilateral couldn't
22 be combined, because in the long term they're
23 essentially the same thing.

24 MR. TAVARES: Well, I think you probably
25 could combine those. The reason we separated them

1 is because actually the investor-owned utilities
2 separate their bilateral contracts that they do
3 have. And those give a little bit more certainty
4 as to what the prices are going to be in the
5 future.

6 And the spot market prices do not.
7 Those are forecasted based on some assumptions,
8 and also using some different models.

9 For instance, we hear the Commission in
10 the past have used a marketing model to forecast
11 market prices. And that's why we separated it.

12 But I mean, if those are the same to
13 your members, again, that's fine, so long as you
14 provide us with the information and the work
15 papers.

16 MR. BASS: One of the themes at
17 yesterday's meeting was that the answer to a lot
18 of my questions was to use the best information
19 available that the particular supplier had. And
20 then to just document what the assumptions were.

21 MR. TAVARES: Correct.

22 MR. BASS: On these forms can I work
23 under essentially that same model?

24 MR. TAVARES: Exactly the same model,
25 yeah.

1 MR. BASS: Okay.

2 MR. TAVARES: We're asking for the best
3 you can.

4 MR. GIBBONS: Okay, that helps me with
5 answering some of the questions I have here. Now
6 I don't need to ask you.

7 MR. TAVARES: Okay. Yeah, we're asking
8 for the best you can and we will do the best we
9 can.

10 MR. BASS: On the form it says megawatt
11 hours and revenues. The general question here is
12 under revenues, is that truly revenues that you're
13 asking for? Or are you asking for our costs?

14 MR. TAVARES: Well, actually the
15 revenues for the -- the ESP is actually the cost.
16 The way we use revenue requirements is because,
17 for instance, in the case of the investor-owned
18 utilities, those are revenues that the California
19 Public Utilities Commission approves. And those
20 revenues will be collected from the customers.

21 But, in this instance they are the same,
22 so you get (inaudible) costs.

23 MR. BASS: We had some trouble
24 understanding on page 2 of form 3.a this breakout
25 of transmission distribution and other services.

1 And then your presentation here was very helpful.

2 Let me ask some followup questions to this so that

3 I'm making sure that I understand this right.

4 So, when there is this line entitled
5 transmission, are these the costs that we expect
6 to receive from the Cal-ISO?

7 MR. TAVARES: Yes. And also some ESPs,
8 I assume, they don't own the transmission lines.
9 And there's some charges coming from either the
10 investor-owned utilities or a municipal utility
11 that what you have an agreement with.

12 I understand that ESPs, in order to
13 transmit and distribute the power, since they
14 don't have the lines, they have to contract with
15 IOUs or a muni.

16 MR. BASS: And then under distribution,
17 we have there distribution services. That one's a
18 little trickier to ask this question, because the
19 distribution services are paid for by the
20 customers directly to the particular IOU.

21 There is a very rare circumstance in
22 which the billing option is what's called
23 consolidated billing supplier, consolidated
24 billing -- or here in California called ESP
25 consolidated billing.

1 In that particular case, then, the
2 distribution services would be paid for by the
3 supplier, the ESP. Is this the kind of
4 assumptions and documentation that you would want
5 to see as we list out what we think the
6 distribution services would be?

7 MR. TAVARES: Absolutely. You can tell
8 us whether this is paid actually by the customer
9 directly to the either IOU or the muni, or to you.
10 Depends, you know, what the ESP contract is for.

11 MR. BASS: And then other services.
12 Would you please elaborate on that? What sort of
13 items are you looking for under other services?

14 MR. TAVARES: Actually, to tell you the
15 truth, I don't have anything in mind. Each and
16 every muni, each and every IOU, each and every
17 ESP, community choice aggregator might have
18 something else, some category that we didn't
19 listed.

20 And in those categories are important to
21 be included so that we have a more accurate
22 estimate of the rates. We would like to have
23 those. But, again, we don't have anything in mind
24 right now.

25 MR. BASS: Okay, so to paraphrase, it

1 would be a -- it's essentially a catch-all
2 category in order to --

3 MR. TAVARES: Catch-all category.

4 MR. BASS: -- accurately reflect what
5 we, you know, to kind of accurately reflect the
6 total costs that we would forecast?

7 MR. TAVARES: Yes.

8 MR. BASS: Okay. And then my next set
9 of questions is in reference to form 3.b. If I
10 understand 3.b correctly, you're going to want
11 this form filled out by customer class?

12 MR. TAVARES: Right. And I understand
13 that some ESPs might not even have allocations to
14 customer classes, but probably they do have
15 estimates of rates for a different type of
16 customer, whether it is commercial customer or
17 industrial customer.

18 So, in that case, you don't have those
19 allocations, what we would like to see how you
20 estimate rates for the different type of
21 customers.

22 MR. BASS: Okay, that's helpful. So
23 then to make sure that I understand this
24 correctly, if the ESPs were to supply this by the
25 way they chunk up their -- well, that's going

1 to -- they way they view or parcel out the
2 different customer classes, however that's
3 defined, then that would be okay?

4 MR. TAVARES: That's fine.

5 MR. BASS: Okay.

6 MR. TAVARES: As long as you provide the
7 work papers, --

8 MR. BASS: Okay.

9 MR. TAVARES: -- then that would be
10 fine. From the staff point of view, again.

11 MR. BASS: Okay. What if we were to
12 provide it by utility rather than by customer
13 class? This was the kind of question I was
14 debating whether or not to ask. But since I'm
15 here.

16 If we provided these forms by utility,
17 so in other words, these would be our estimates
18 going forward in the different utilities'
19 jurisdictions. Is that at too high a level? Or
20 is that off the mark?

21 MR. TAVARES: No, that's fine. I mean
22 are you talking about providing those rates for
23 different territories, like PG&E's territory or
24 Edison's territory?

25 MR. BASS: Yes.

1 MR. TAVARES: Actually Mike has some
2 comments.

3 DR. JASKE: I have a different answer.
4 That's not fine.

5 (Laughter.)

6 DR. JASKE: And the reason that's not
7 fine is --

8 MR. BASS: Okay.

9 DR. JASKE: -- that what we're trying to
10 do with these retail rate projections, from all
11 LSEs, irrespective of category, is understand the
12 rate in front of certain, for economically defined
13 groups of customers, --

14 MR. BASS: Okay.

15 DR. JASKE: -- and that is particularly
16 important in the context of the policy preferences
17 that the agencies have put forth in IEPR and
18 procurement decisions, et cetera, emphasizing an
19 efficiency demand response distributed generation.
20 Unless we have some sense of what retail customers
21 are paying, you know, in these some kind of broad
22 classes, it's very difficult to understand what
23 the pocketbook perspective of those customers is
24 to partake of those kinds of demand side
25 preferences.

1 MR. BASS: Okay. All right, thank you.

2 (Pause.)

3 MR. BASS: Okay. I appreciate you
4 taking the time and answering my questions very
5 much. And look forward to filing our comments in
6 the next week or so. Thank you, again. And thank
7 you, Commissioners.

8 PRESIDING MEMBER GEESMAN: Thank you.

9 MR. ALVAREZ: Manuel Alvarez, Southern
10 California Edison. You heard from us earlier this
11 morning and yesterday, also. And I guess I wanted
12 to bring up one point that Commissioner Geesman
13 brought up, this issue of confidentiality.

14 I was hoping to put a finer point on the
15 discussion yesterday. We're all aware of the
16 differences between the confidentiality
17 requirements.

18 And I guess part of my comment yesterday
19 on my faith-based policy proposal was hopefully
20 that we would come to a resolution within the
21 state on what the confidentiality standards are
22 and availability. But I know the difficulties
23 there.

24 PRESIDING MEMBER GEESMAN: I think this
25 Commission would like that very much. I'm not

1 certain that you would be satisfied with the way
2 it was resolved, but I think that this Commission
3 very clearly sees a need for that type of
4 resolution.

5 MR. ALVAREZ: It's a worthy discussion
6 for having. The other issue I just wanted to make
7 clear that in the staff's request for providing
8 the best information that we have available and
9 providing it from other sources.

10 When you referred to providing you the
11 assumptions that go forward in some category of
12 projections, if we know a certain information in
13 terms of its current value, but the assumption is
14 just to hold that constant, will that satisfy you
15 going forward, since we have no other basis by
16 which to project a category?

17 MR. TAVARES: Well, again, it's up to
18 the utility to make that judgment. I mean if you
19 assume that this is going to carry forward, we can
20 take your assumptions.

21 We, at the staff level, might have
22 different information, and might be able to change
23 those assumptions, ourselves.

24 MR. ALVAREZ: Okay, that's what I
25 understood. I guess what I would suggest to the

1 Committee, perhaps this is something that further
2 down the road, as you complete this process of
3 data collection and the next set of forms and
4 information you're going to be requesting is that
5 the Committee might want to consider establishing
6 a working group of various individuals in the
7 various companies and organizations that can sit
8 down and actually go through some of those details
9 with the staff. And then bring that information
10 forward to you. And where there's information of
11 disagreements or controversy, those could be
12 brought forward for your condition.

13 PRESIDING MEMBER GEESMAN: I think
14 that's a good idea. I guess the perspective that
15 I would suggest that you take is the same type of
16 information that you would present to a large
17 customer that might be considering signing a
18 contract with an ESP, or a municipality that might
19 be considering setting up a community choice
20 aggregation program, or perhaps municipalizing its
21 utility services.

22 Those types of entities are going to
23 call on you, as you well know, for some longer
24 term projections. And those are projections in
25 that context which utility companies have been

1 willing to make.

2 And I think people need to recognize
3 that they represent your best estimates at the
4 time and are subject to the underlying assumptions
5 that you use in making those projections.

6 But, rather than simply holding a value
7 constant when you don't have assurance or
8 certainty as to what the change will be, what the
9 staff is asking you for is to make your best
10 estimate.

11 MR. ALVAREZ: We understand that. Thank
12 you.

13 PRESIDING MEMBER GEESMAN: Thanks.

14 MR. TAVARES: Any more questions?

15 MR. KENNEDY: If there are no other
16 questions on the detailed forms and instructions,
17 I think we can move towards wrapping this up,
18 actually.

19 And if anyone has any sort of final
20 closing comments that they would care to make this
21 would be a good opportunity for that.

22 One thing I would like to remind folks
23 is that we have asked for any written comments
24 coming out of this workshop and yesterday's
25 workshop to be filed by September 30th. So we

1 would appreciate it if you can make that filing
2 deadline.

3 We definitely appreciate all of the
4 participation that we have had yesterday and
5 today. And, once again, thanks for putting up
6 with a bit of chaos yesterday.

7 Do the Commissioners have anything that
8 they want to say before we close?

9 Okay. Well, thank you all very much. I
10 think it's been a very productive meeting. Thank
11 you.

12 (Whereupon, 11:00 a.m., the Committee
13 Workshop was adjourned.)

CERTIFICATE OF REPORTER

I, PETER PETTY, an Electronic Reporter,
do hereby certify that I am a disinterested person
herein; that I recorded the foregoing California
Energy Commission Committee Workshop; that it was
thereafter transcribed into typewriting.

I further certify that I am not of
counsel or attorney for any of the parties to said
workshop, nor in any way interested in outcome of
said workshop.

IN WITNESS WHEREOF, I have hereunto set
my hand this 1st day of October, 2004.
